Rectangle — C++ Program

```
#include<iostream>
using namespace std;

class Rectangle {
private:
    double length;
    double breadth;

public:
    // Member function defined inside the class
    void setDimensions(double l, double b) {
        length = l;
        breadth = b;
    }

    // Member function declarations for definition outside class
    double calculateArea() const;
    double calculatePerimeter() const;
    void display() const;
};

// Definition outside the class using scope resolution operator ::
double Rectangle::calculateArea() const {
    return length * breadth;
}

double Rectangle::calculatePerimeter() const {
    return 2 * (length + breadth);
}

void Rectangle::display() const {
    cout << "\n--- Rectangle Details ---\n";
    cout << "Length : " << length << " units\n";
    cout << "Breadth : " << breadth << " units\n";
    cout << "Area : " << calculateArea() << " sq units\n";
    cout << "Perimeter : " << calculatePerimeter() << " units\n";
}

int main() {
    Rectangle rect;
    double l, b;
    cout << "Enter length of rectangle: ";
    cin >> l;
    cout << "Enter breadth of rectangle: ";
    cin >> b;
    rect.setDimensions(l, b);
    rect.display();
    return 0;
}
```
